

Stop boat thieves in their TRACKS!

## Hi-tech TRACKING and MONITORING for boats, out-boards and jet-skis.

Boats, motorcycles, jet-skis and ATVs provide hours of fun and relaxation to owners, but they're also easy prey for thieves. These unscrupulous individuals are more sophisticated than ever. They can recognize most security devices a mile away and can disable them in a matter of minutes. Unfortunately, owners don't know a thing until it's too late and the perpetrators are long gone.

If a prowler opens a door or hatch, you'll know about it. If the water level gets too high in the bilges, you'll know about it. You'll even know the state of the battery before you get out of bed in the morning. How's that for peace of mind?

Say you set up a geo-fence perimeter of 200 meters. If your asset travels outside this invisible fence, you'll be alerted and provided a

clickable link to Google Maps, which shows its exact location. If it's still moving,

just kill the engine via your phone and stop the perpetrators in their tracks.

And the best part about this geo-fence tracking, power-saving, report-sending device? There are no expensive monitoring fees. You may even be eligible for a discount on your insurance premium.

According to a company spokesperson, "It has everything we liked about our commercial and industrial M2M product line, only simplified, compacted into a weather-proof case and sold at an unbelievably affordable price."

Vigil Marine aims to change that with Vigil geo, a self contained tracking, monitoring and control device that

instantly sends a text message if your vessel or vehicle is tampered with or moved outside of a certain radius.

This "set it and forget it" security system allows you to go on with your day, secure in the knowledge that your asset is protected from mechanical mishaps and human interference.

Vigil Marine's founders and engineers have worked in the boating industry for more than 40 years. They used this knowledge and experience in designing Vigil geo specifically for the marine industry. There are a few similar devices already on the market, but they were designed to be installed in large, dry, air-conditioned bridges.

In contrast, Vigil geo is the most rugged, adaptable device on the market. It's totally water resistant, can be installed out of sight in any watercraft or recreational vehicle, and can withstand the most unforgiving environments. Engineers even submerged it in a full fish tank—after which it kept working perfectly.

The cell phone-sized Vigil geo has no outside antennas or markings and can be easily bolted inside an outboard engine, jet-ski cowling or just about anywhere. It's designed to run off the boat battery, and can be upgraded to use shore power or solar energy. It also has its own built-in, standby lithium ion rechargeable battery which provides up to four days of unsupported standby power.

Just insert a prepaid or postpaid GSM SIM card and you have total access to battery voltages, ambient temperatures, a powerful GPS geo-fence and an anti-tamper system that alerts you to trouble instantly, via text message.

Look for Vigil geo at your local chandler or contact us at [www.vigilmarineco.com](http://www.vigilmarineco.com) or [info@vigilmarineco.com](mailto:info@vigilmarineco.com).
